

# Transverse-Momentum-Dependent Wave Functions of Pion from Lattice QCD

*Thursday, November 16, 2023 3:20 PM (20 minutes)*

We present a first lattice QCD calculation of the transverse-momentum-dependent wave functions (TMDWFs) of the pion using large-momentum effective theory. Numerical simulations are based on one ensemble with 2+1+1 flavors of highly improved staggered quarks action with lattice spacing  $a = 0.121$  fm from the MILC Collaboration, and one with 2 + 1 flavor clover fermions and tree-level Symanzik gauge action generated by the CLS Collaboration with  $a = 0.098$  fm. As a key ingredient, the soft function is first obtained by incorporating the one-loop perturbative contributions and a proper normalization. Based on this and the equal-time quasi-TMDWFs simulated on the lattice, we extract the light-cone TMDWFs. The results are comparable between the two lattice ensembles and a comparison with phenomenological parametrization is made. Our studies provide a first attempt of ab initio calculation of TMDWFs which will eventually lead to crucial theory inputs for making predictions for exclusive processes under QCD factorization.
