Monday May 12, 2025 @ 15:45 to 16:30 (PST)

SCAN ME

# Main Take Home Message: Let's Work Together!

**Exhortation: The appearance of inefficiently duplicating efforts at multiple facilities runs some risk under the present funding context.**

**FRIB is eager to proactively support the needs of the FS community in places where it may be able to play a unique role:**

1. Offline access to some interesting isotopes ( $^{225}\text{Ra}$ ,  $^{229}\text{Pa}$ , others?) by direct production via the Isotope Harvesting program.
2. General collaborative support for radiochemistry for anyone anywhere
3. People (searching for an FS staff scientist now- see **QR Code**), space, and capital equipment for FS experiments physically hosted at FRIB
4. Plans for a general-purpose beamline that utilizes harvested isotopes (US NSF MRI)
5. Administrative/logistical/organizational support for Center-level effort to help provide a “home-base” within the US context
6. DOE Office of Science has requested a FRIB Director's Review.

**FRIB PIs: Jaideep Taggart Singh (Spinlab), Xing Wu (QUEST)  
Shane Wilkins (starting July 1)**

- Atomic  $^{225}\text{Ra}$  EDM in a laser trap
- Polar molecules trapped in noble gas solids (EDM-cubed)
- $^{229}\text{Pa}$  nuclear structure measurements
- $^{229}\text{Pa}$  ions implanted in optical crystals/diamonds
- Centrifuge slowing of cold atoms and molecules
- Optical cycling properties of interesting molecules
- Cold sources for radioactive molecules

# Electric Dipole Moment (EDM): Measures the Separation of Charges

$$\vec{d} = \int \rho_{\text{charge}} \left( \vec{r} - \vec{R}_{\text{CM}} \right) d^3r = \langle \rho_{\text{charge}} \vec{r} \rangle - Q \vec{R}_{\text{CM}}$$

$\vec{d}$

$\rho_{\text{charge}}$  = charge distribution

$\vec{r}$  = position vector

$\vec{R}_{\text{CM}}$  = center of mass

$Q$  = net charge

"Thunder Cloud as Generator #2" (1971) by Paterson Ewen [Art Gallery of Ontario]

# 2023 EDM Limits:

## “Free” of Standard Model (SM) “Backgrounds”

Chupp, Fierlinger, Ramsey-Musolf, JTS RMP 91:015001 (2019) & Nature 562:355 (2018)  
& PRL 124:081803 (2020) & PRL 129:231801 (2022) & Science 381:46 (2023)

System	Best Limit (95%) 1E-28 $e$ cm	SM estimate 1E-28 $e$ cm	Method (Location)
Neutron	220	$\sim 10^{-4}$	ultracold neutrons in a bottle (PSI)
“Electron”	0.11	$\sim 10^{-7}$	cold ThO beam (JHU / UC / Harvard / Northwestern)
	0.05		trapped HfF <sup>+</sup> (JILA / Boulder)
<sup>199</sup> Hg	0.074	$\sim 10^{-6}$	atoms in vapor cell (UW-Seattle)

Imagine a <sup>199</sup>Hg atom that is composed of two oppositely charged hemispherical shells each with charge magnitude  $e$ ...

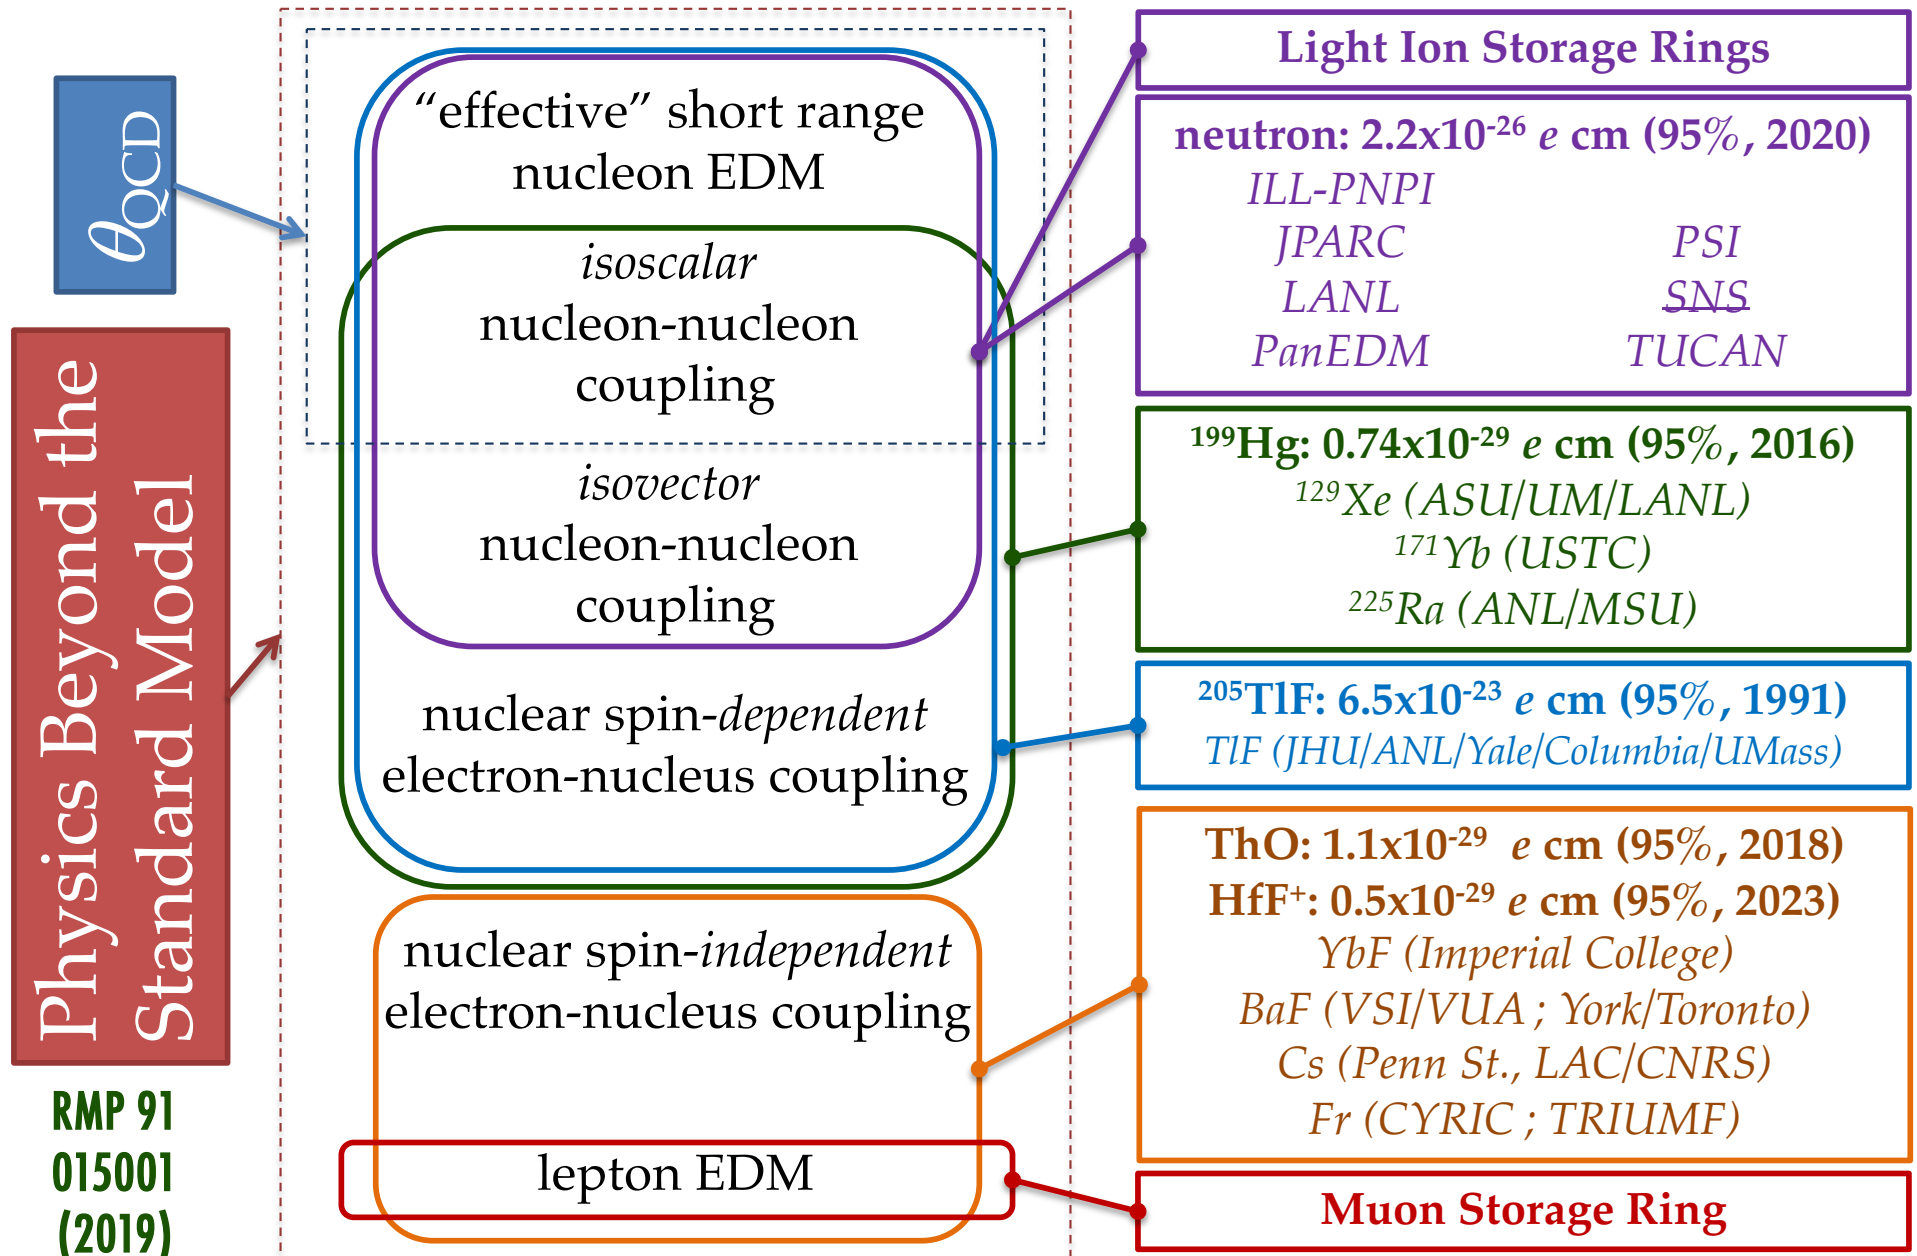

...if the <sup>199</sup>Hg atom was the size of the Earth, then the maximum thickness of these shells would be less than the diameter of a strand of human hair.

# 2016: Atomic EDM of $^{199}\text{Hg}$ (Stable) In A Vapor Cell The Gold Standard For Over 40 Years!

- diamagnetic,  $^1S_0$  ground state
- $I = 1/2$ , no elect. quad. moment
- high  $Z$ , (80) rel. atomic struct.
- stable, (17% n.a.) 92% enriched
- high vapor pressure, ( $10^{13} / \text{cm}^3$ )
- modest electric field, 10 kV / cm
- 40+ year old experiment!

Limiting systematic appears to be  $\sim 10$  nm scale motion of vapor cells when HV is switched in the presence of 2<sup>nd</sup> order  $B$ -field gradients.

$$\nu = 8.3 \text{ Hz}$$

$$\Delta\nu \leq 0.1 \text{ nHz}$$

The best limit on atomic EDM:

$$\text{EDM}(^{199}\text{Hg}) < 0.74 \times 10^{-29} \text{ e-cm (95\% C.L.)}$$

Graner et al., PRL 116:161601 (2016)

# $\mathbb{P}$ & $\mathbb{T}$ Physics: First Order Perturbation Theory

$$S_z = \frac{\langle er^2 z \rangle}{10} - \frac{\langle r^2 \rangle \langle ez \rangle}{6}$$

$$S \equiv \langle \Psi_0 | S_z | \Psi_0 \rangle = \sum_{k \neq 0} \frac{\langle \Psi_0 | S_z | \Psi_k \rangle \langle \Psi_k | V_{\mathbb{PT}} | \Psi_0 \rangle}{E_0 - E_k} + \text{c.c.}$$

- The  $\mathbb{P}$  and  $\mathbb{T}$  physics that we seek (unknown & common to all isotopes)

# Isotopes With Nearly Degenerate Nuclear States

$$S_z = \frac{\langle er^2 z \rangle}{10} - \frac{\langle r^2 \rangle \langle ez \rangle}{6}$$

$$S \equiv \langle \Psi_0 | S_z | \Psi_0 \rangle = \sum_{k \neq 0} \frac{\langle \Psi_0 | S_z | \Psi_k \rangle \langle \Psi_k | V_{\mathbb{P}\mathbb{T}} | \Psi_0 \rangle}{E_0 - E_k} + \text{c.c.}$$

- Difference in lab-frame nuclear energy levels
- The  $\mathbb{P}$  and  $\mathbb{T}$  physics that we seek (unknown & common to all isotopes)

# Nuclear Schiff Moment in the Lab Frame

$$S_z = \frac{\langle er^2 z \rangle}{10} - \frac{\langle r^2 \rangle \langle ez \rangle}{6}$$

$$S \equiv \langle \Psi_0 | S_z | \Psi_0 \rangle = \sum_{k \neq 0} \frac{\langle \Psi_0 | S_z | \Psi_k \rangle \langle \Psi_k | V_{\mathbb{P}\mathbb{T}} | \Psi_0 \rangle}{E_0 - E_k} + \text{c.c.}$$

- Body-frame Schiff moment – large when there are intrinsic nuclear deformations
- Difference in lab-frame nuclear energy levels
- The  $\mathbb{P}$  and  $\mathbb{T}$  physics that we seek (unknown & common to all isotopes)

Example of large intrinsic Schiff moment: Pear-shaped nucleus in the “body-frame”

# Pear-Shaped Nuclei = Nearly Degenerate Parity Doublets

$$S_z = \frac{\langle er^2 z \rangle}{10} - \frac{\langle r^2 \rangle \langle ez \rangle}{6}$$

$$S \equiv \langle \Psi_0 | S_z | \Psi_0 \rangle = \sum_{k \neq 0} \frac{\langle \Psi_0 | S_z | \Psi_k \rangle \langle \Psi_k | V_{\text{PT}} | \Psi_0 \rangle}{E_0 - E_k} + \text{c.c.}$$

Parity Doublet

- Nearly degenerate parity doublet

Haxton & Henley PRL 51:1937 (1983)

$$\begin{array}{l} \overline{\hspace{1cm}} \\ \Delta E \updownarrow \\ \underline{\hspace{1cm}} \end{array} \quad \begin{array}{l} |\Psi_1\rangle = \frac{|\alpha\rangle \mp |\beta\rangle}{\sqrt{2}} \\ |\Psi_0\rangle = \frac{|\alpha\rangle \pm |\beta\rangle}{\sqrt{2}} \end{array}$$

# Pear-Shaped Nuclei = Enhanced Intrinsic Schiff Moments

$$S_z = \frac{\langle er^2 z \rangle}{10} - \frac{\langle r^2 \rangle \langle ez \rangle}{6}$$

$$S \equiv \langle \Psi_0 | S_z | \Psi_0 \rangle = \sum_{k \neq 0} \frac{\langle \Psi_0 | S_z | \Psi_k \rangle \langle \Psi_k | V_{\text{PT}} | \Psi_0 \rangle}{E_0 - E_k} + \text{c.c.}$$

## Parity Doublet

- Nearly degenerate parity doublet

Haxton & Henley PRL 51:1937 (1983)

- Large intrinsic Schiff moment due to octupole deformation

Auerbach, Flambaum, & Spevak PRL 76:4316 (1996)

$$\begin{array}{l} \overline{\hspace{1cm}} \\ \uparrow \Delta E \\ \underline{\hspace{1cm}} \end{array} \quad \begin{array}{l} |\Psi_1\rangle = \frac{|\alpha\rangle \mp |\beta\rangle}{\sqrt{2}} \\ \\ |\Psi_0\rangle = \frac{|\alpha\rangle \pm |\beta\rangle}{\sqrt{2}} \end{array}$$

# Example: Enhanced Sensitivity in Radium-225

$$S_z = \frac{\langle er^2 z \rangle}{10} - \frac{\langle r^2 \rangle \langle ez \rangle}{6}$$

$$S \equiv \langle \Psi_0 | S_z | \Psi_0 \rangle = \sum_{k \neq 0} \frac{\langle \Psi_0 | S_z | \Psi_k \rangle \langle \Psi_k | V_{PT} | \Psi_0 \rangle}{E_0 - E_k} + \text{c.c.}$$

## Parity Doublet

**FRIB will make lots of Pa-229!**

# Ground State Parity Doublet Energy Splitting

## The Muddled Picture for $^{229}\text{Pa}$ (1980-2015)

1980: Theoretical prediction: 100 eV

PLB 96(1-2):7-10

1982: Experimental claim from ANL: 220(50) eV

PRL 49:1758-61

1988: Theoretical calculation: 400 eV

PRC 37:2744-78

1991: No ground state parity doublet found in German experiment!

PRC 44:R1728-31

1993: No evidence for octupole deformation from German experiment!

PPNP 28:429-34

1994: Weak octupole collectivity now claimed by German experiments!

NPA 576:267-307

2015: Full reanalysis of 1982 ANL experiment + incorporation of data from German experiments: **Original claim of 220 eV conversion electrons is gone.**  
If there is a ground state parity doublet, then it must be 60(50) eV.

PRC 92:024313 (2015)

# Two Complementary Paths To Search For a Low-Lying Nuclear State in $^{229}\text{Pa}$

	$^{229}\text{Th}$	$^{229}\text{Pa}$
A	229	229
Z	90	91
N	139	138
$\Delta E$	8.36 eV	(60 +/- 50) eV?
PD?	$5/2^+$ $3/2^+$	$5/2^+$ $5/2^-$

<https://physics.aps.org/articles/v17/71>

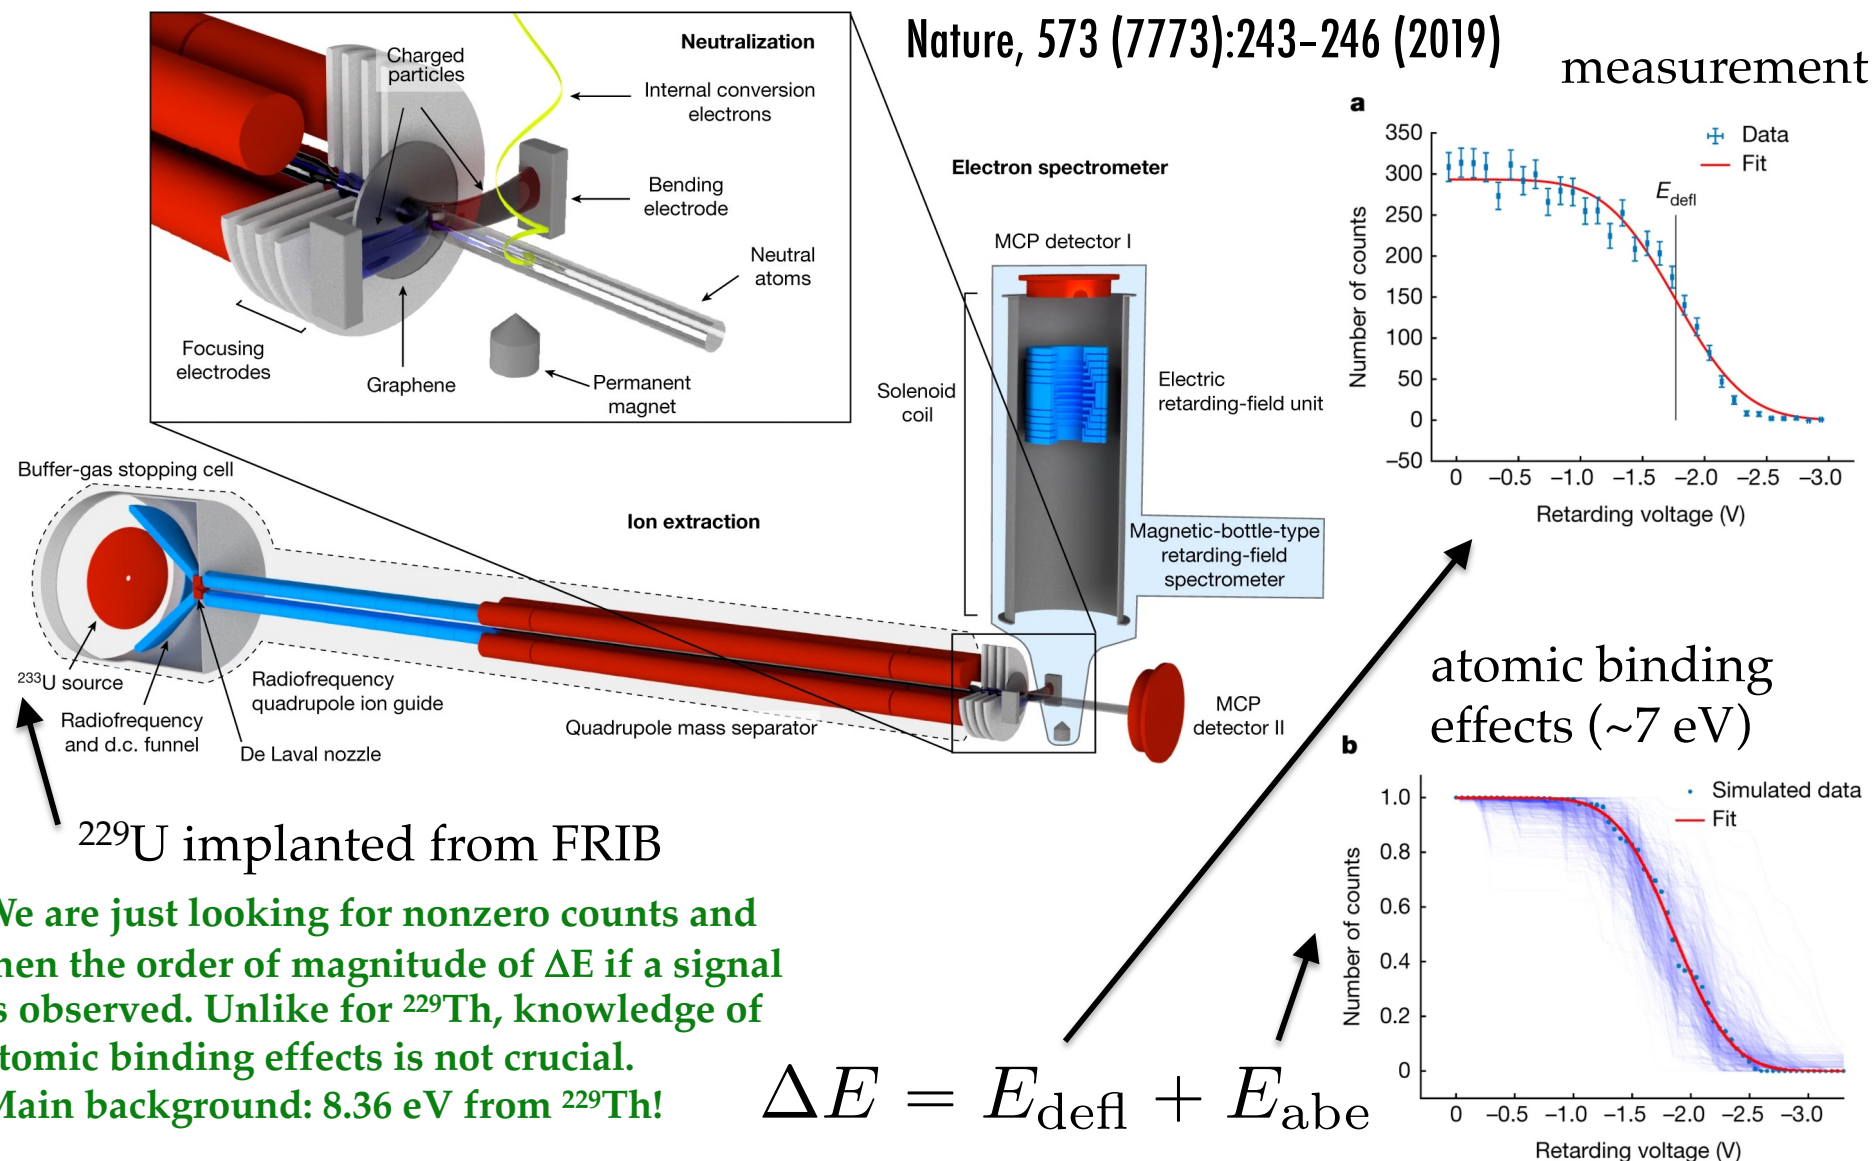

# Awarded Today @ 09:56! Direct Gamma Detection (40-80 eV) w/ LLNL: Stephan Friedrich & Marie-Anne Descalle

<https://www.meetoptics.com/academy/ellipsoidal-mirrors#what-are-ellipsoidal-mirrors>

# Spinlab Pending: The $^{229}\text{Th}$ Measurement Technique: Integrated Conversion Electron Spectroscopy

$^{229}\text{U}$  implanted from FRIB

We are just looking for nonzero counts and then the order of magnitude of  $\Delta E$  if a signal is observed. Unlike for  $^{229}\text{Th}$ , knowledge of atomic binding effects is not crucial.  
Main background: 8.36 eV from  $^{229}\text{Th}$ !

# Heavy Pear-Shaped Nuclei Inside Molecules/Solids

**Enhancements:** nuclear Schiff moment enhancement of  $\times 1000$  ( $^{225}\text{Ra}$ )  
to maybe(!?!)  $\times 1000000$  ( $^{229}\text{Pa}$ )  
*and*  $\sim 100$  MV / cm effective internal  $E$ -field (lab  $< 1$  MV / cm)  
[N.B. the nucleus feels a different  $E_{\text{eff}}$  than the electrons!]

**Potential:**  $\times 10^5$  to  $\times 10^{10}$  more new physics sensitivity than the  $^{199}\text{Hg}$  experiment on a per atom basis.

**Opportunity:**  
Isotope harvesting @ FRIB:  
from “Beam to Beaker”  
( $^{225}\text{Ra}$ ,  $^{229}\text{Pa}$ , ...)

Nature Physics 20, p741–749 (2024)

## Challenges:

- How do we get the harvested isotopes from “Beaker” into an experiment?
- How do we calibrate the new physics sensitivity of these “enhancer isotopes” inside of molecules?
- How do we efficiently form & probe short-lived radioactive molecules?

# Spinlab: Pear-Shaped Nuclei Implanted In Cryogenic Solids:

$^{225}\text{RaF}/^{225}\text{RaO}$  ( $\tau_{1/2} = 15$  days) &  $^{229}\text{Pa}$  ( $\tau_{1/2} = 1.5$  days)

- Efficient trapping of a wide variety of species
- Very high number densities
- Stable and chemically inert confinement
- Transparent in the optical regime for optical probing
- Under certain conditions, polar molecules orient themselves along the crystal axes which allows for control of systematics: [PRA 98:032513 \(2018\)](#)
- **Challenge: quantum control in rare gas solids**
- Ions implanted in optical crystals or diamonds allowing for optically-addressable nuclear spins  
[Hyp. Int. 240:29 \(2019\)](#), [Phil. Trans. R. Soc. A.382: 20230169 \(2024\)](#), [PRA 108, 012819 \(2023\)](#)
- Implanted ions can sit at two distinct sites with opposite pointing internal E-fields which allows for control of systematics [PR 131 1912 \(1963\)](#)

# Controlling Systematics in Solids: The RB-Experiment

$\text{Cr}^{3+}$  in  $\text{Al}_2\text{O}_3$ : Royce & Bloembergen Phys. Rev. 131 1912 (1963)

→ external B-field

**Key Concept:** In the absence of external fields, the non-degeneracy of a Kramers Doublet is an indication of time-reversal symmetry violation.

# “Stark Splitting:” There Are Two Ensembles of Ions!

$\text{Cr}^{3+}$  in  $\text{Al}_2\text{O}_3$ : Royce & Bloembergen Phys. Rev. 131 1912 (1963)

$\longrightarrow$  external B-field

**Key Concept:** Under the right conditions, ions (& molecules...) in solids are oriented along the crystal axes.

# Apply E-Field Only During State Detection!

$\text{Cr}^{3+}$  in  $\text{Al}_2\text{O}_3$ : Royce & Bloembergen Phys. Rev. 131 1912 (1963)

$$\Delta\nu_{\text{EPR}} = \frac{4\Delta m d E}{J}$$

**Key Concept: Apply a lab  $E$ -field only during the detection/readout step just to spectroscopically distinguish the two ensembles!**

# Key Idea to Control Systematics in Solids: Two Nearby Sites Where Effective E-fields Are Opposed

PRA 98:032513 (2018)

BaF/RaF orientations  
(in/out not depicted here)

**Key Concept: No lab  $E$ -field during the spin precession step minimizes the sensitivity of the frequency measurement to external  $E$ -fields.**

Orientation-dependent hyperfine structure of polar molecules in a rare-gas matrix: A scheme for measuring the electron electric dipole moment

The Stark shift of the hyperfine states of polar molecules embedded in a solid rare-gas matrix is found to depend on the molecular orientation. This finding may significantly improve the measurements of the electron electric dipole moment by using large ensembles of polar molecules trapped in rare-gas matrices with orientation-dependent detections.

# Electrospray Ionization Could Be Very Efficient!

*Anal. Chem.* **2010**, *82*, 9344–9349

## Achieving 50% Ionization Efficiency in Subambient Pressure Ionization with Nanoelectrospray

**Ioan Marginean, Jason S. Page, Aleksey V. Tolmachev, Keqi Tang, and Richard D. Smith\***

*Biological Sciences Division, Pacific Northwest National Laboratory, P.O. Box 999, Richland, Washington 99352, United States*

Inefficient ionization and poor transmission of the charged species produced by an electrospray from the ambient pressure mass spectrometer source into the high vacuum region required for mass analysis significantly limits achievable sensitivity. Here, we present evidence that, when operated at flow rates of 50 nL/min, a new electrospray-based ion source operated at ~20 Torr can deliver ~50% of the analyte ions initially in the solution as charged desolvated species into the rough vacuum region of mass spectrometers. The ion source can be tuned to optimize the analyte signal for readily ionized species while reducing the background contribution.

# Spinlab: $^{225}\text{RaF}$ / $^{225}\text{RaO}$ in Noble Gas Solids

## Electrospray ionization

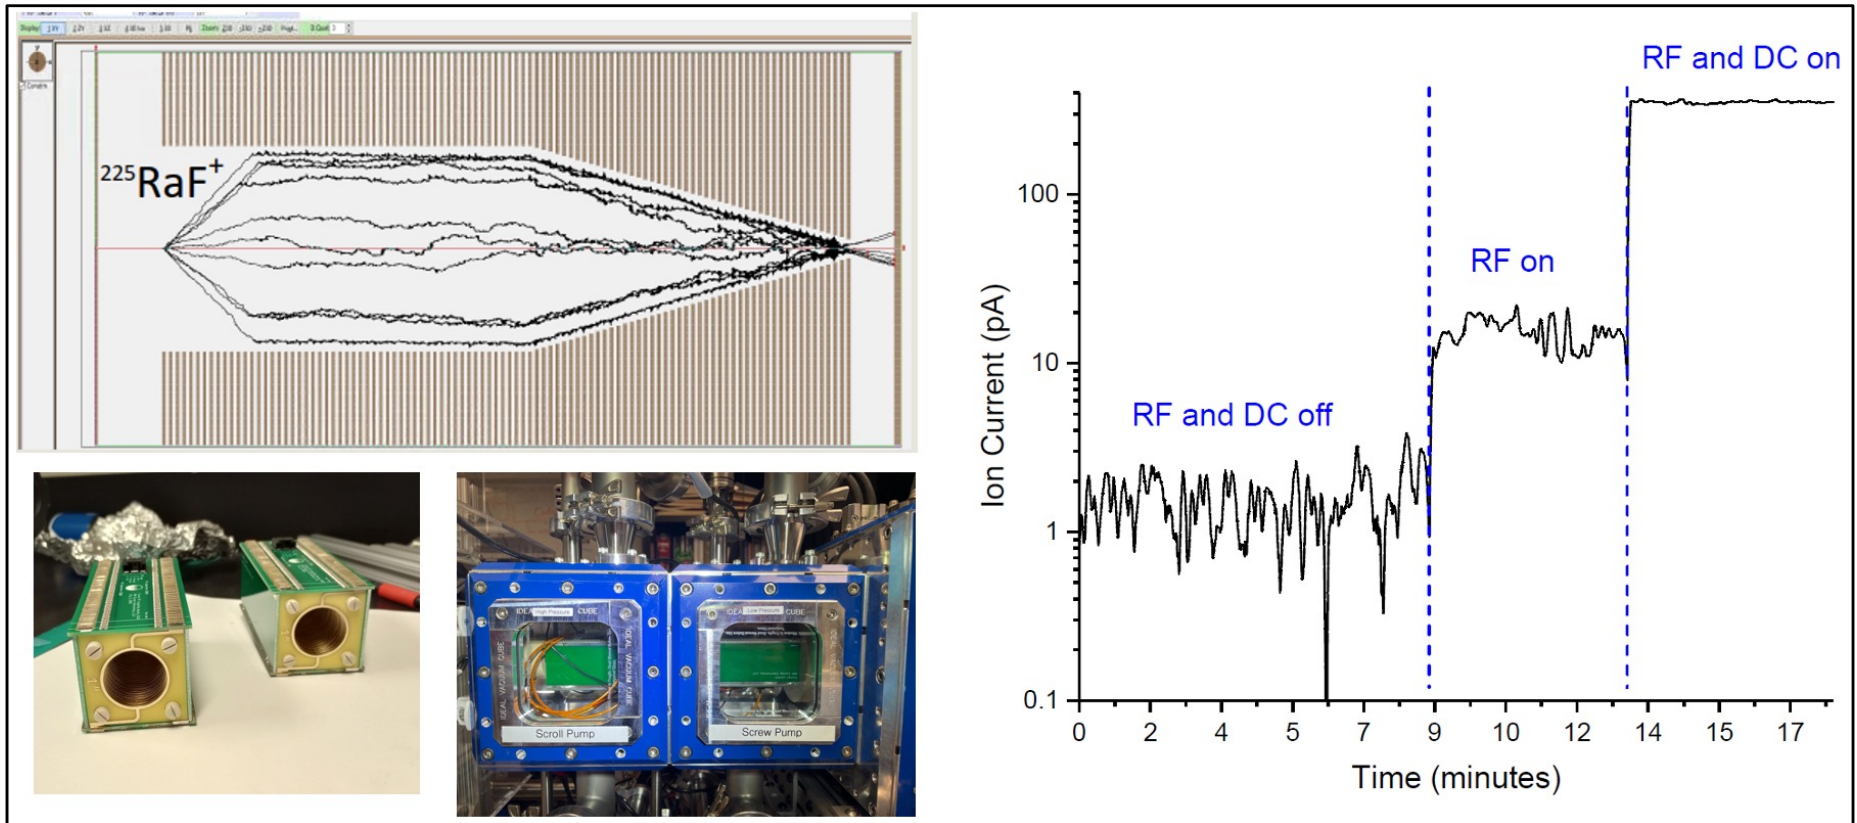

Anal. Chem.80:1800 (2008)

Anal. Chem.82:9344 (2010)

- creates molecular ions which are focused and filtered with ion optics
- ionization utilization efficiency <50%
- ideal for small radioactive samples

# Spinlab: Testing With Isopropanol: Ion Funnel Work Well! (~\$5k off the shelf)

## Stable ion beams are possible:

- Can be used during installation to test ion optics
- Optimizing applied bias

## Challenges:

- Low reproducibility
- Lack of control over positioning and probe alignment

# FRIB is eager to invest in unique off-line opportunities!

**Exhortation: The appearance of inefficiently duplicating efforts at multiple facilities runs some risk under the present funding context.**

**FRIB is eager to proactively support the needs of the FS community in places where it may be able to play a unique role:**

1. Offline access to some interesting isotopes ( $^{225}\text{Ra}$ ,  $^{229}\text{Pa}$ , others?) by direct production via the Isotope Harvesting program.
2. General collaborative support for radiochemistry for anyone anywhere
3. People (searching for an FS staff scientist now- see **QR Code**), space, and capital equipment for FS experiments physically hosted at FRIB
4. Plans for a general-purpose beamline that utilizes harvested isotopes (US NSF MRI)
5. Administrative/logistical/organizational support for Center-level effort to help provide a “home-base” within the US context
6. DOE Office of Science has requested a FRIB Director’s Review.

**FRIB PIs: Jaideep Taggart Singh (Spinlab), Xing Wu (QUEST)  
Shane Wilkins (starting July 1)**

- Atomic  $^{225}\text{Ra}$  EDM in a laser trap
- Polar molecules trapped in noble gas solids (EDM-cubed)
- $^{229}\text{Pa}$  nuclear structure measurements
- $^{229}\text{Pa}$  ions implanted in optical crystals/diamonds
- Centrifuge slowing of cold atoms and molecules
- Optical cycling properties of interesting molecules
- Cold sources for radioactive molecules
